

IRPQuests

My database I am going to use is going to be postgres that is hosted on supabase. I chose this database due to the fact that my application would use a many to one database schema. I have gone ahead and attached a screenshot of my document for this reason.

The **userAccount** table contains the user's email, username, userid, and password associated with the account. This will be used with tail wind to access this information for the UI, As well as be used for the user's login. The **userReward** table contains all the rewards associated with the account as well as the coin values. The **userCoins** table contains the coins associated with the user's account. Finally the **userQuests** table contains the quests associated with the user.
